### Plastification of metal elements

Plastification involves preparation i.e. degreasing and phosphating of metal surfaces, then application of epoxy anti-corrosion layer, and over it a polyester coating for surfaces that are exposed to the sun's UV rays. On galvanized elements, aluminum and interior elements, after preparation, only one layer of epoxy or polyester is applied.

The prices of plastification are shown in Euros, without vat, in dinars by the selling rate of NBS on the day of payment. The price depends on the total surface of the colored elements.

We give a discount for larger amounts of elements for plastification. These prices are valid for mostly flat or partially complicated surfaces, and cannot be applied for pipes and locksmith structures.

Total square meters	Euro/m2
0 - 10	6
10 - 20	5,5
20 - 50	5
50 - 100	4,5
100 - 200	4

200 - 500	3,5
500 - 1000	3
over 1000	2,8

These prices don't refer to colors that belong to the group of special effects.

Quality is not lower even if we give a discount!

Prices can be discussed in case of long cooperation.
